

User Manual:

In order to use our program, run View.java which will launch the console based program.

```
Please input the path of the file that holds the facebook graph information

You inputted an invalid file path. Please try again or enter Q to quit

You inputted an invalid file path. Please try again or enter Q to quit
fkdfaldfj
You inputted an invalid file path. Please try again or enter Q to quit
```

The first thing you will be prompted for is the input file path for the file that contains the facebook user information. The file contains a pair of space separated numbers that represents friendships amongst different users in the graph. You will be continually prompted until you enter a valid file path or enter Q to quit.

Once the file path has been entered, you will be prompted with the following options:

```
Please input the path of the file that holds the facebook graph information

u inputted an invalid file path. Please try again or enter Q to quit

u inputted an invalid file path. Please try again or enter Q to quit
dfaldfj
u inputted an invalid file path. Please try again or enter Q to quit
ustering_coefficient_graph

lcome to your friendly facebook analytics
ter 1 to find how well a user's clustering coefficient
ter 2 to get friend recommendations for a user based on triadic closure
orted in increasing order of the number of traidic closures of a recommendation)
ter 3 to get friend recommendations for a user based on triadic closure (sorted in increasing order of the centrality o
ter 4 to find out which friends of a user serve as local bridges
ter Q to quit
```

You can either enter 1, 2, 3, 4 or Q. Q will quit and terminate the program. If you enter either 1, 2, 3 or 4, you will be prompted to enter the user id of the user you want information about. Pressing 1 will print out the clustering coefficient for this user. Pressing 2 and 3 will both print out friend recommendations, both sorted in a particular way. Pressing 2 will consider all friends that fulfill triadic closures in the graph and print them out from the friend recommendation that will fulfill the least number of triadic closures to the one that will fulfill the most. Pressing 3 will instead organize recommendations in increasing order of betweenness centrality values of

the recommendations. Pressing 4 will print out the friends of the inputted user id that are connected to the user via a local bridge.

```
Welcome to your friendly facebook analytics
Enter 1 to find how well a user's clustering coefficient
Enter 2 to get friend recommendations for a user based on triadic closure
(sorted in increasing order of the number of triadic closures of a recommendation)
Enter 3 to get friend recommendations for a user based on triadic closure (sorted in increasing order of the number of triadic closures of a recommendation)
Enter 4 to find out which friends of a user serve as local bridges
Enter Q to quit
```

Please enter the user id

```
The clustering coefficient of user with id 5 is 0.6666666666666666
```
